EDUCATION

•Master of Science in Data Science

September 2024 – Present

ETH Zürich, Switzerland

GPA: 5.6/6

- Coursework: *Mathematical Foundations* (Mathematics of Data Science, Algorithmic Foundations of Data Science), *Machine Learning Architectures* (Probabilistic Artificial Intelligence, Machine Perception, Deep Learning)
- Specialization: *Robotics* (Dynamic Programming and Optimal Control, Planning & Decision Making for Autonomous Robots, Recursive Estimation)
- Research: *reasoning with diffusion models* for puzzle solving, post-training LLMs for tool-calling, breaking machine translations using gradient-based methods.

•Bachelor of Science in Artificial Intelligence

September 2021 – June 2024

University of Groningen, Netherlands

GPA: 9.3/10

- Interdisciplinary degree combining computer science, machine learning, psychology, philosophy, and ethics of AI.
- Additional 85 ECTS in Math & CS: PDEs, Functional Analysis, Computational Complexity, Optimization. . .
- Extracurricular Honours Programme: 45 ECTS of deepening (research projects in robotics) and broadening (courses from different faculties).

WORK EXPERIENCE

•AI Researcher

February 2026 – Present

Tufa Labs

Zürich, Switzerland

- I am working as part of the research team on the ARC-AGI-3 benchmark.

•Research Assistant – part-time

February – August 2025

Oracle Labs Switzerland

Zürich, Switzerland

- I applied test-time scaling to improve performance of agents in cloud operations: benchmarked efficacy of models for assistance in resolving cloud issues and implemented changes in agentic framework to support reasoning.

•Research Assistant

April 2024

German Research Center for Artificial Intelligence (DFKI)

Bremen, Germany

- I developed and tested online learning framework for robots state estimation accelerated using uncertainty.

•Software Engineer – part-time

February – June 2024

ASML Netherlands

Veldhoven, Netherlands

- I developed and tested factory automation and integration software, which prevents human errors, and thereby decreases iteration time of development.

RESEARCH PROJECTS

•Compositional Reasoning with Diffusion Models for OOD Generalization ([REPORT](#))

February 2026

Research Project at Distributed Computing Group at ETH Zurich

- I trained a discrete diffusion model to solve simple grid puzzles, and I have benchmarked its extrapolative capabilities.

•Exploring Double Pendulum Dynamics with Neural Networks ([REPORT](#))

June 2023

Machine Learning Semester Project at Rijksuniversiteit Groningen

- We compared 4 types of neural networks, including Hamiltonian neural network (HNN), on the task of modeling a dynamical system of a double pendulum. We show HNN performs better than PINN for energy conservation.

2025

ACHIEVEMENTS & SCHOLARSHIPS

•2nd Place Gemini Hackathon Paris, image synthesis for forensic actor identification

March 2026

•Top #50 on ICPC NWERC, international algorithmic programming contest

2023

•Jong Talent Prijs, KHMW award for best performance in first-year of bachelor's degree

November 2022

•TKKF University Scholarship, financial support for talented students abroad

2022 – 2024

•National Round Math Olympiad Czechia, national contest in solving mathematical questions

2021
